1 PURPOSE

The Dolphin Energy Information Technology (IT) strategy provides a framework for all IT initiatives, projects and activities. It also provides a reference point for business planning and defines alignment between Company long term strategic objectives and IT principles and roadmap.

The IT strategy is structured in three main areas: the demand strategy, the control strategy and the supply strategy. The demand strategy describes how IT contribution is mapped to Company business objectives. The controls strategy defines how IT performance and IT services delivery are governed. Finally the supply strategy details how IT is delivering value to Company business users and meeting the business needs.

2 SCOPE

This document is outlining the Dolphin Energy IT strategy as well as describing the IT alignment with Dolphin Energy business requirements, its control and governance principles and its IT services supply strategy.

Information Security strategy is outside the scope of this document since within Dolphin Energy IT and Information Security are two separate departments. Information Security have their own defined strategies and policies and IT work in very close alignment to ensure that these are enforced within the IT environment.

The industrial network is not managed by IT and therefore is not covered under this IT strategy document.

5 TERMS AND DEFINITIONS

These should be limited to those items which are required to improve the clarity of the document, avoiding exhaustive listings and obvious definitions.

Term	Description

6 ABBREVIATION

A list of all abbreviations/acronyms, together with their meanings.

Abbreviation	Description
APM	Application Portfolio Management
CISO	Corporate Information Security Officer
COTS	Commercial Off The Shelf
DEMS	Dolphin Energy Management System
ERM	Enterprise Risk Management
IT	Information Technology
ITIL	Information Technology Infrastructure Library
KPI	Key Performance Indicator
P&C	Procurement and Contracts
SLA	Service Level Agreement

Note: In this document the abbreviations are also mentioned by spelling out the word in full the first time it is used and adding abbreviation in parentheses ().

7 RESPONSIBILITIES AND AUTHORITIES

7.1 Responsibilities

The key responsibilities of the IT Department are summarized below:

a. Advise the business on technology evolutions and potential business benefits of new technologies
b. Contribute to value creation through digitizing processes and service delivery
c. Deliver Company IT projects across all Dolphin locations as per plan and budget
d. Enforcement of information security policies and procedures
e. Enhance Company business processes value-chain by delivering reliable, efficient and integrated services and solutions as and when needed by the business, in line with the Corporate strategy
f. Ensure availability and security of Enterprise Information systems and the associated IT services
g. Ensure Corporate alignment in terms of IT processes, policies and procedures, and enforce them in all sites
h. Ensure efficient use and utilization of IT systems
i. Ensure global integration and availability at all times of Network, Telecom, Systems, Applications, Hardware, Software, Security, Data and Skills in a flexible and secured IT environment
j. Ensure ongoing and operational alignment with business needs, Corporate and IT strategies
k. Guarantee the satisfaction of business units by catering to their requirements

l. Justify investments in IT services with business cases, return on investments studies and total cost of ownership optimization
m. Maintain Corporate IT governance and control mechanisms
n. Maintain internal and external Service Level Agreements (SLAs) between IT and Dolphin's business units which define the support services delivered by the different IT entities to internal users, and between Dolphin and external contractors
o. Maintain IT Key Performance Indicators (KPIs), to measure and to meet the required performance, in line with the Strategy and Corporate Planning Department Corporate KPIs for IT
p. Maintain IT security architecture to protect Dolphin assets from internal and external attacks/intrusions, in line with Corporate Information Security requirements
q. Maintain performance measurement practices in terms of service delivery, project delivery, end user satisfaction and cost control
r. Manage the provision and support of IT services and data/voice telecommunication to all Dolphin locations both in UAE and Qatar
s. Meet expectations of all stakeholders, employees, clients, suppliers and shareholders
t. Optimize IT services to provide better business efficiency
u. Provide strong support to the Future Forward Program to meet Company digital transformation requirements
v. Provide sustainable, efficient, reliable and secure IT solutions and services
w. Strengthen organization objectives by providing best in class integrated solutions and services
x. Train end users on Company systems and applications to achieve a good return on investments

The main activities of the different departments within IT can be summarized as per the table below:

IT Department	Main Activities
Technology Solutions	• Manage Technology Solutions projects • Provision, maintain and enhance SAP services to all Dolphin locations, both in UAE and Qatar • Provision, maintain and enhance in-house and third-party business application services to all Dolphin locations, both in UAE and Qatar • Provision, maintain and enhance technical application services to all Dolphin locations, both in UAE and Qatar • Provision, maintain and enhance Database and Linux services to all Dolphin locations, both in UAE and Qatar • Improve seamless integration across Industrial and Corporate solutions • Manage the Application Portfolio Management (APM) program
IT Operations	• Manage IT Operations projects • Provision, maintain and enhance IT systems, networks, storage, data / voice communications and infrastructure application services to all Dolphin locations, both in UAE and Qatar • Manage IT security, in line with Information Security requirements • Manage end user support

IT Department	Main Activities
IT Quality and Control	• Manage IT Quality and Control Projects • Manage IT strategy, governance, architecture, technology roadmap, business plan and performance reporting • Provide IT Project Management support to other IT departments • Maintain this document in line with Company DEMS requirements

The key IT objectives for IT in terms of IT personnel are to:

a. Align with Company nationalization objectives
b. Avoid external dependencies by ensuring full knowledge transfer on IT standards and projects
c. Develop an IT project managers community and increase their readiness on project management methodologies
d. Develop National IT professionals in line with the succession plan
e. Develop standard skills to avoid single point of failure on key personnel
f. Develop synergies and share resources and skills across IT teams
g. Increase IT professional's Information Technology Infrastructure Library (ITIL) competencies
h. Increase IT professional's security competencies
i. Develop additional skills and awareness as required, to keep up with the latest technologies

7.2 Authorities

None

8 METHODOLOGY

The IT strategy provides a reference point for all IT activities. It also provides a framework for the IT architecture and roadmaps, and the IT business plan, and has to be fully aligned with Company strategy and long-term objectives.

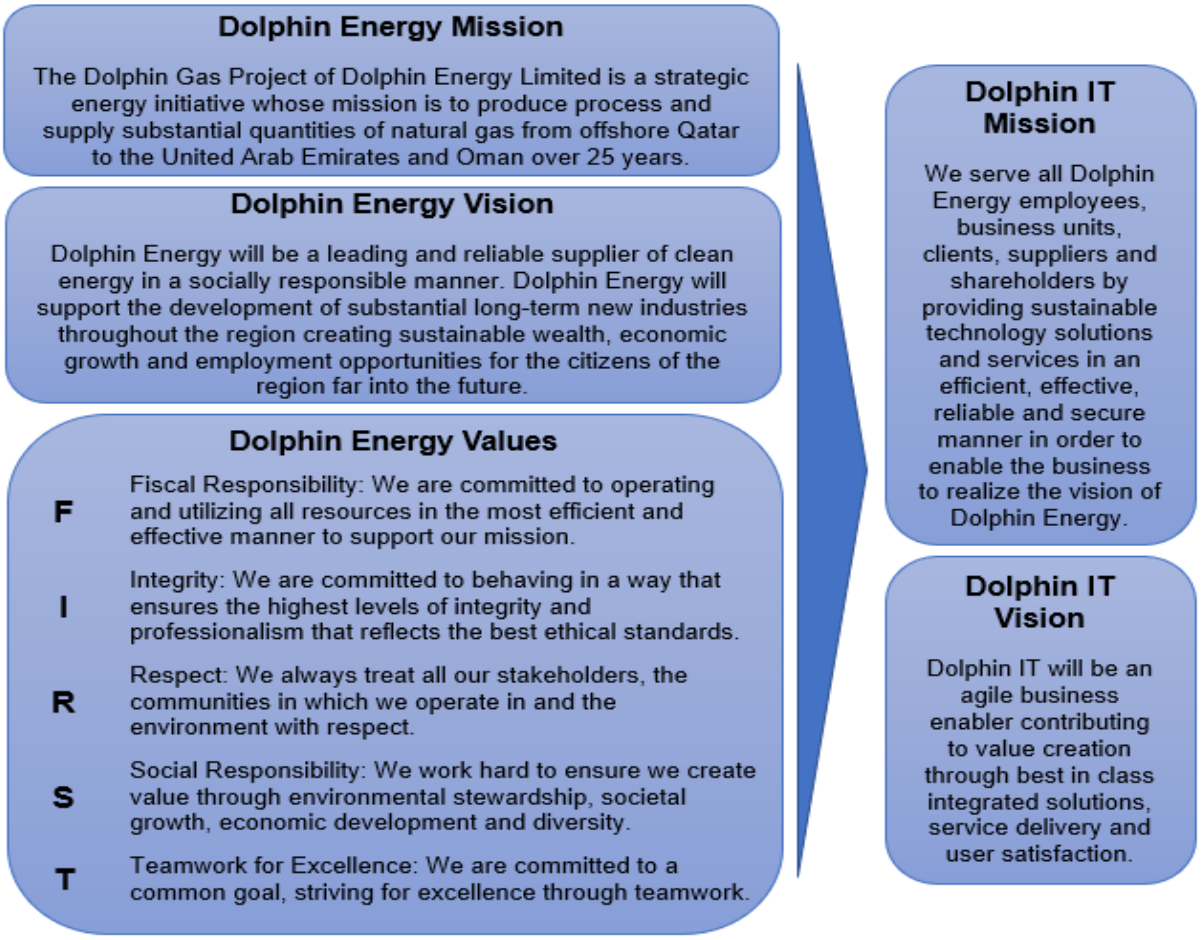
All IT activities must be managed and governed through comprehensive control mechanisms enabling a service oriented, performance driven and quality-based delivery model by leveraging synergies across teams and relying on industry best practices.

IT strategic objectives are to primarily align IT service delivery with business requirements, to maximize internal customer satisfaction and to maximize the usage of Information Technologies for the benefit of the Company.

The IT strategy calls for a global integration and availability anywhere, anytime of network, telecom, systems, applications, hardware, software, data and skills in a flexible but secured IT environment.

It is also part of IT responsibilities to focus on sustainable solutions and maximize the quality of IT services while optimizing the total cost of ownership.

Finally, as an organization IT must promote Dolphin Energy nationalization objectives, develop its resources in line with the succession planning and develop a strong Corporate identity.



8.1 Business Context

Dolphin Energy Limited was established in Abu Dhabi in 1999 to import substantial quantities of natural gas via sub-sea pipeline from Qatar. The first gas was received during July 2007 and the full production (2 billion cubic feet of gas per day which is equivalent to 350,000 barrels of oil) was reached in February 2008.

The founders had always conceived Dolphin as a force for international cooperation – one that would unite the vision and resources of the region with multinational capital and expertise. Total of France was accordingly invited to become a shareholder in Dolphin Energy during 2000. After a further selection process, Occidental Petroleum of the USA became the company's second international partner in 2002.

The three Dolphin Energy Limited shareholders are Mubadala Development Company with 51 percent, and Total and Occidental Petroleum with 24.5 percent each. Mubadala Development Company is wholly owned by the Government of Abu Dhabi.

The Dolphin Gas Project has been completed by the delivery of three distinct elements that can be best summed up in the industry terms "upstream" (drilling, extracting of raw gas offshore in Qatar's North Field and processing onshore at Dolphin's complex gas processing plant in Qatar's Ras Laffan Industrial City where valuable by-products are

taken out for international sale), “midstream” (transport by export pipeline to Taweelah in Abu Dhabi, UAE) and “downstream” (distribution to customers in Abu Dhabi, Dubai, the Northern Emirates and Oman from the Taweelah Receiving Facility).

The ultimate but indirect customers of Dolphin Energy natural gas are UAE citizens (and partially those of Oman) through the delivery of clean and cost-efficient energy to power, water and industry plants. Other products extracted from the raw gas (ethane, condensate, propane, butane and sulphur) are sold to Qatar industries and international world liquids market.

The overall investment in constructing the entire Dolphin Gas Project – wells, sealines, processing plant, export pipeline and receiving facilities – made it one of the largest energy-related ventures ever undertaken in the Middle East. Dolphin Energy is currently supplying 30 percent of the UAE’s need for natural gas at a very attractive price, which provides a unique and strategic position.

Dolphin Energy has to operate and run its activities within the terms of the Development and Production Sharing Agreement (DPSA) whereby the Abu Dhabi Government and its partners in Dolphin Energy would invest in the appraisal, drilling and construction of the upstream facilities in the dedicated concession area in the North Field. In return, Dolphin Energy would share with Qatar the income from the valuable by-products extracted at its Ras Laffan Gas Processing Plant, while buying all the natural gas for export to UAE and Oman.

Dolphin Energy’s stakeholder groups directly and indirectly affect the company’s strategic decision-making, polices, social ties, business outcomes, and sustainability to produce, process and supply natural gas to our customers. The overall strategic plan of Dolphin Energy includes five business drivers, which stimulates Dolphin Energy’s three pillars of excellence.

The business drivers are:

a. Driving Growth
b. Disciplined Financial Choices
c. Maximizing our People Potential
d. Operational Excellence
e. Significant Industry Changes

The pillars are of excellence are:

a. Operating with Excellence
b. Value Creation
c. Sustainability Excellence

The Company's corporate strategic goals, strategic objectives, Key Performance Indicators (KPIs), and risks are all integrated under the pillars of excellence.

Theme	Strategic Goal
Operating with Excellence	• Provide Clean Energy and Optimizing By Products • Ensure Efficient and Safe Operations • Meeting and Exceeding Stakeholder Expectations
Value Creation	• Good Governance, Management and Integrity • Creating Economics Opportunity and Value • Being Employer of Choice through a Positive and Productive Working Environment
Sustainability Excellence	• Minimizing Environmental Impacts • Community Engagement and Optimizing Social Impact

Major projects and conducted by Dolphin Energy IT should be in alignment with the above Strategic Goals.

8.2 IT Contribution to Business Success

IT contribution to Dolphin Energy business success is driven by its ability to:

a. Contribute to upstream and downstream alignment
b. Be proactive to business needs and supporting operational efficiency by providing the right solution
c. Ensure critical IT services availability and security
d. Optimize IT services quality and user satisfaction
e. Build up fiscal and social responsibility

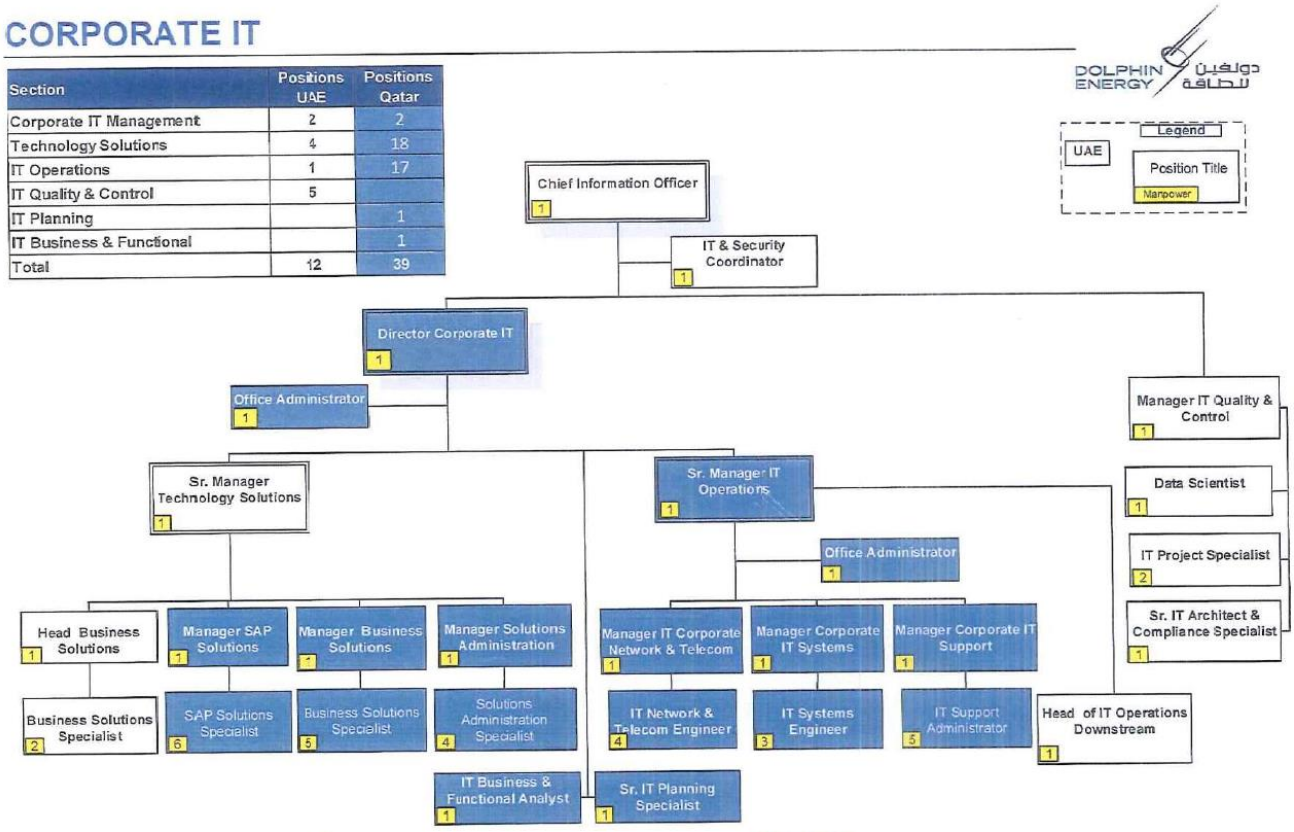
These initiatives are delivered through the following tactical drivers:

IT Contribution	Tactical Driver
Upstream and Downstream Alignment	• Standardize IT processes across IT functions and maintain Corporate IT governance • Provide secure and reliable communication and collaboration services across UAE and Qatar • Promote the use of IT shared services
Be Proactive to Business Needs and Support Operational Efficiency	• Ensure IT alignment with business needs • Maintain and monitor service level agreements between IT and business departments • Ensure efficient monitoring and management of IT assets and resources • Enhance and automate business processes by leveraging Enterprise workflow automation

IT Contribution	Tactical Driver
Ensure Critical IT Services Availability and Security	• Contribute to Company business continuity strategy through IT business continuity and disaster recovery plans • Ensuring high availability by design for critical IT services • Proactive monitoring and alerting • Alignment and enforcement of information security policies and procedures • Continuous improvement of systems and network security
Optimize IT Services Quality and User Satisfaction	• Deliver IT services as per agreed service levels and optimized IT processes and procedures • Maintain and improve seamless integration across applications where it supports a business need • Rationalize and reduce proliferation of IT systems that are not sustainable • Optimize Information Technology and applications usage • Develop user awareness and readiness • Regularly monitor and collect feedback on user satisfaction of IT services
Build up Fiscal and Social Responsibility	• Pursue green IT initiatives • Achieve Company Nationalization objectives in line with succession plans • Constantly review and optimize IT services total cost of ownership through benchmarking exercises

8.3 IT Organization

The Dolphin Energy IT department is led by the Chief Information Officer and formed across the UAE and Qatar as shown below. The department consists of three main teams, IT Operations, IT Quality and Control, and Technology Solutions. Additional positions are outsourced to Injazat Data Systems.

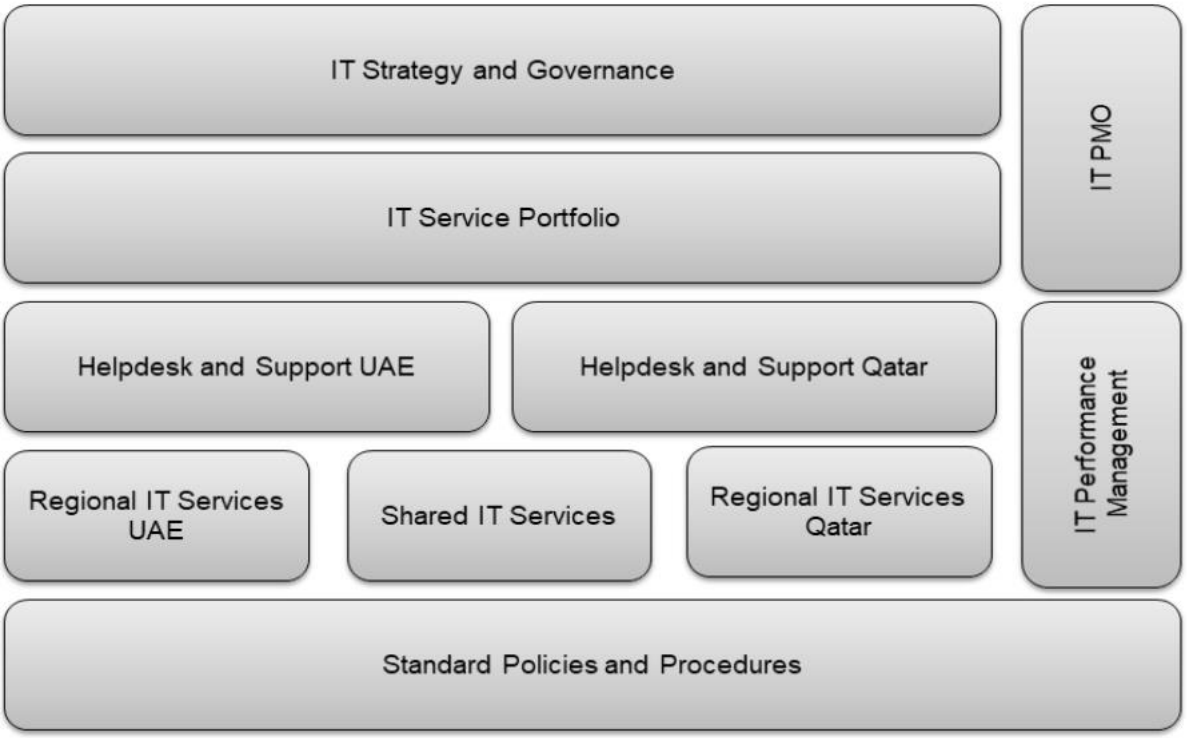


Section	Positions UAE	Positions Qatar
Corporate IT Management	2	2
Technology Solutions	4	18
IT Operations	1	17
IT Quality & Control	5	
IT Planning		1
IT Business & Functional		1
Total	12	39

Reflecting IT contribution to Dolphin Energy business success, the fundamentals of the IT strategy are derived from the following principles:

a. We will act as One Company, One IT
b. We will set security as our primary concern
c. We will maintain a strong demand management framework with the business
d. We will maintain a service-oriented culture driven by IT service performance
e. We will standardize IT portfolios and processes
f. We will give priority to communication means between UAE and Qatar
g. We will optimize business workflow automation and decision-making solutions
h. We will enforce a contract strategy based on fixed price and performance as well as encourage commercial solutions versus internal developments
i. We will optimize IT cost of ownership and rely on proven solutions
j. We will be socially responsible and build up sustainability

The diagram below presents the high-level IT functional organization:



The table below maps the owning and contributing departments for providing the above functions:

IT Function	Owner	Contributor
IT Strategy and Governance	IT Quality and Control	IT Operations Technology Solutions
IT Service Portfolio	Technology Solutions	IT Operations IT Quality and Control
Helpdesk and Support UAE	IT Operations Downstream	IT Quality and Control Technology Solutions
Helpdesk and Support Qatar	IT Operations Upstream	IT Quality and Control Technology Solutions
Regional IT Services UAE	IT Operations Downstream Technology Solutions	IT Quality and Control
Shared IT Services	IT Operations Technology Solutions	IT Quality and Control
Regional IT Services Qatar	IT Operations Upstream Technology Solutions	IT Quality and Control
Standard Policies and Procedures	IT Quality and Control	IT Operations Technology Solutions

IT Function	Owner	Contributor
IT Performance Management	IT Quality and Control	IT Operations Technology Solutions
IT PMO	IT Quality and Control	IT Operations Technology Solutions

8.4 IT Processes

The key defined IT processes followed in order to achieve the department goals and objects are summarized in the below table. These are also mapped at Company level to other processes such as audit, risk management and document management:

IT Process	IT Sub-Process	Managed By
IT Strategy and Organization		IT Quality and Control
IT Security		IT Operations
IT System Acquisition		IT Operations IT Quality and Control Technology Solutions
Manage IT Infrastructure	IT Workplace Management	IT Operations
	IT Systems Management	IT Operations
	IT User Management	IT Operations
IT Asset Management		IT Operations Technology Solutions
IT Service Management	IT Capacity Management	IT Operations
	IT Change Management	IT Quality and Control
	IT Configuration Management	IT Operations
	IT Incident Management	IT Operations
	IT Problem Management	IT Operations
IT DR and Continuity		IT Quality and Control
IT Project Management		IT Quality and Control
IT Risk Management		IT Quality and Control

8.5 IT Demand Strategy

The core of the IT strategy is based on Demand, Control and Supply strategies, to gather the requirements for business demand, apply the right controls and governance, and ensure that the right services are supplied in the most effective manor to meet the demand.

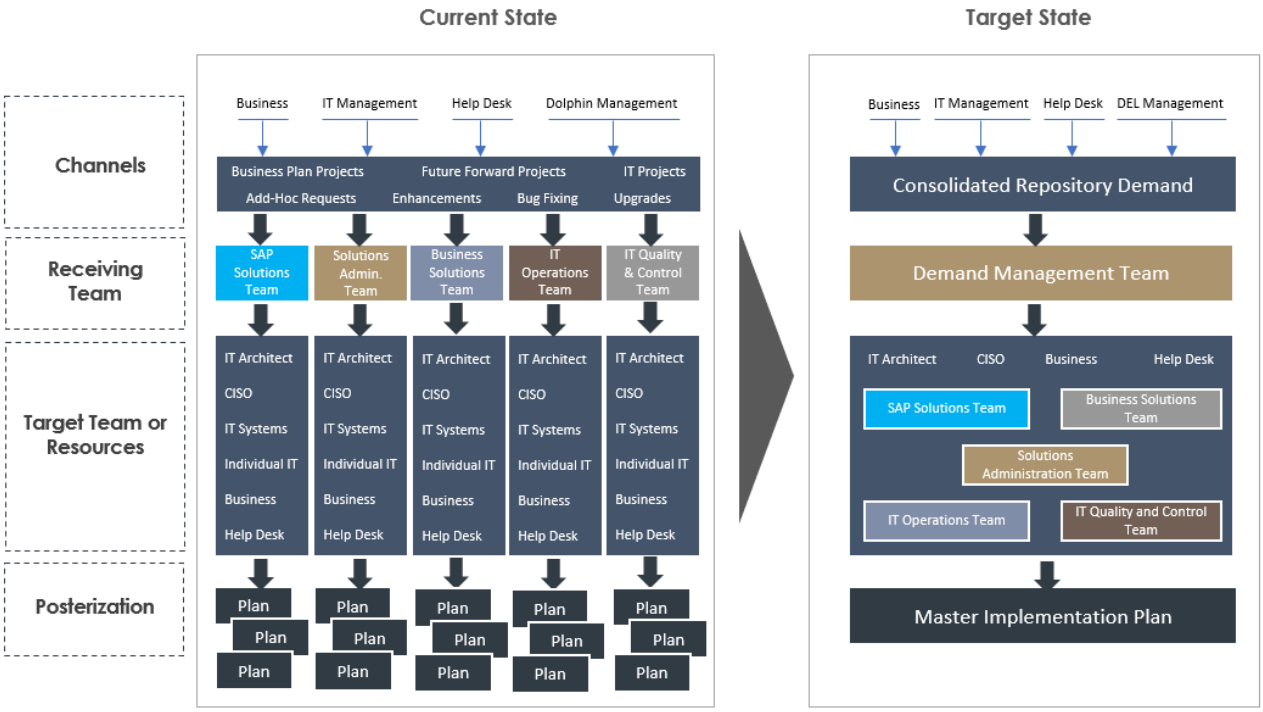
Demand Management is the IT governance process that ensures investments are funded toward the highest-value project. It is a front door to IT so that all incoming requests are collected, prioritized, scheduled, and fulfilled based on objective, consistent criteria and according to business priority, with the aims to understand, anticipate and influence business demand for IT services.

This ensures that IT resources are focused on providing business value through strategic initiatives, using a consistent process to centrally manage and manage and assess requests coming from the business, to alleviate issues such as IT resources spending too much time and effort on low priority tasks, and multiple communication channels and assessment criteria.

The below figure shows the four levels of Demand Management Maturity, the aim of IT being to reach Level III by the end of 2023:

Minimal Capability	Marginal Performer	Qualified Participant	Best In Class
▪ No capacity planning done in IT organization (lack of capacity plans) ▪ Only a fraction of overall demand is recorded ▪ Most projects have no business case, or the business case is weak ▪ Multiple groups exist to record demand, including back-door channels ▪ No consolidation of projects across line-of-business ▪ Budgets allocated to individual line-of-business by 'who shouts loudest' or "last year plus' method	▪ No capacity management process in place ▪ Multiple channels through which demand enters, ▪ User requests are primary source of ideas and compiled into a big list ▪ Non-standard business cases focus on qualitative aspects, limited to costs and benefits ▪ Ad-hoc capacity plans developed only for exceptional cases ▪ Separation of line-of-business specific projects and large initiatives ▪ Budgets allocated to individual line-of-business by clearly defined ROI criteria	▪ Ad-hoc capacity planning process ▪ Contingency set aside to address unplanned high priority projects ▪ Overall IT capacity usage captured and reported but improvement areas not systematically identified ▪ Cross-business consolidation of all planned initiatives is recorded by a single organization, although intermediate organizations may perform "local" aggregation ▪ Formal evaluation process established with limited input from IT. Benefits quantified, sources identified, life cycle costs addressed and formal post implementation reviews done ▪ Strategic investments defined, evaluated, and funded differently than utility but no formal process	▪ Trends (customer/supplier, competitor, industry, technology) are actively tracked to find new ideas ▪ Formal process for finding cross-functional initiatives and developing capacity plan ▪ Formal post implementation reviews have "teeth" ▪ Capacity planning inputs include existing capacity plans, requirements from application delivery and feedback from system administrators ▪ Demand is aggregated, but automatically routed to appropriate level in the organization (i.e., infrastructure requests to IT, projects to enterprise-level committees)
Level I	Level II	Level III	Level IV

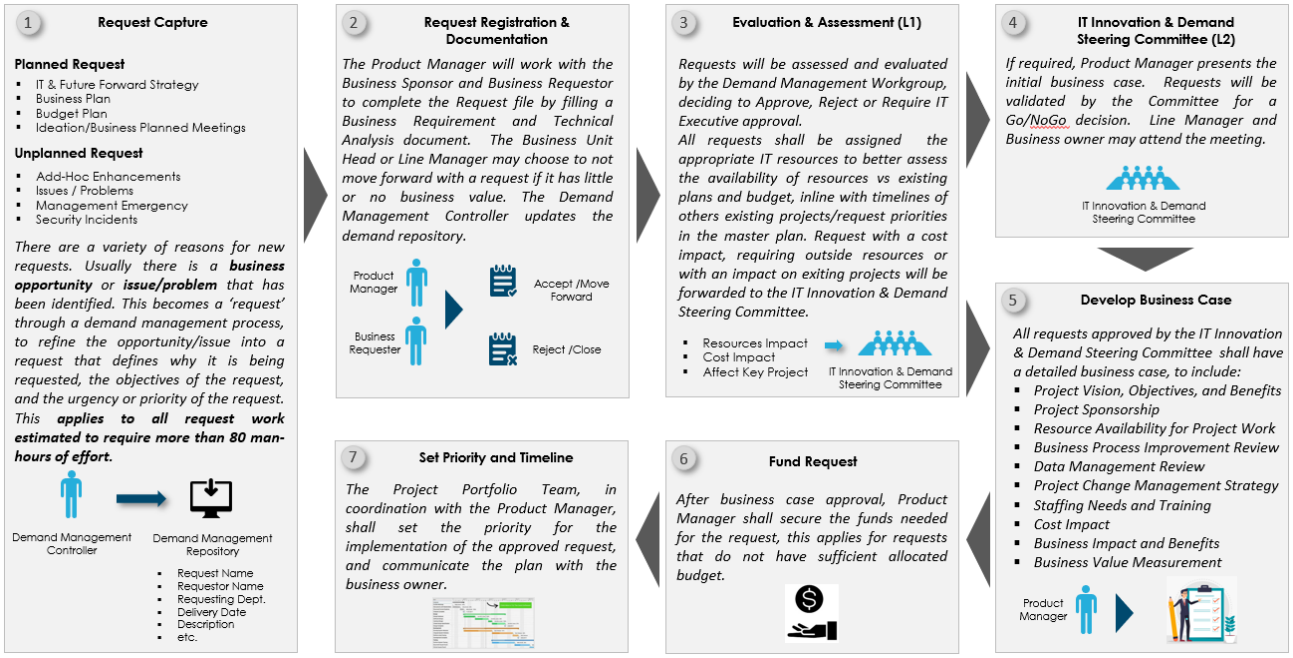
The aim is to migrate from a decentralized to a centralized Demand Management Methodology to increase the maturity level, as depicted in the diagram below:



All demands will be captured, consolidated and assessed centrally and consistently through a dedicated team, and then prioritized and assigned to the appropriate IT team, who will be supplemented by the right people for the Business, Information Security and IT Quality and Control, in order to define and deliver the right solution to meet the demand.

Rather than each team providing separate plans for each demand, these will be consolidated into a master implementation plan, to have a better visualization, management and allocation of IT resources and delivery capabilities across all teams.

The high-level steps forming the overall Demand Management Strategy can be found in the below figure:



Level 1 assessment is conducted by the Demand Management Workgroup, as shown below:

Structure	Roles and Responsibilities
▪ **Chair**[1] – Sr. Manager Technology Solutions ▪ **Permanent Members** – SAP Solutions Manager – Business Solutions Manager – Solutions Administration Manger – Projects Controller – Demand Management Controller ▪ **Optional Members** – Sr. Manager IT Operations (for IT Operations requests) – Manager IT Quality and Control (for IT Quality and Control requests) – IT Subject Matter Experts – Business Subject Matter Experts	▪ Review demand to avoid request duplication and identify areas for synergy ▪ Assess demand against IT strategy, Future Forward strategy and business objectives, to ensure alignment ▪ Assess financial feasibility (business case) and translate IT requirements into IT projects ▪ Create a prioritized list of demand requests/projects, and escalate to IT Innovation & Demand Steering Committee if needed ▪ Approve, adjust or reject demand requests and document reasons for approval or rejection ▪ Project business solutions demand for the coming year and create report and recommendation to serve as input into annual IT strategic plan ▪ Provide improvement opportunities, best practices and innovative solutions to the business based on their needs, allowing increased business ICT skills and awareness and deployment of best-in-class solutions
Meeting Frequency	**Rules of Engagement**
Quarterly / Monthly* / **Weekly** / Bi-Weekly * Ad hoc meeting may be called by the chair as needed	▪ Chair takes the final decisions after consultation with the members ▪ Meeting agenda defined and shared with members prior to the meeting ▪ Documented minutes and decisions ▪ Escalates to IT Innovation & Demand Steering Committee if needed

1) The chair has the ultimate accountability to drive the group's decisions and actions

Where required due to resource, cost or project impact, the assessment is escalated to the IT Innovation and Demand Steering Committee, following the below charter:

Structure	Roles and Responsibilities
▪ **Chair**[1] – Chief Information Officer ▪ **Permanent Members** – Corporate IT Director – Co-Chair – Sr. Manager Technology Solutions – Sr. Manager IT Operations – Manager IT Quality and Control – Corporate Information Security Officer ▪ **Optional Members** – Subject Matter Experts – Business Matter Experts – Business Owner and Business Sponsor – Product Manager	– Review and endorse IT strategic initiatives, projects and ideas to ensure alignment with Dolphin business strategy – Review and endorse IT strategic, operation and business plans – Validate and endorse the business and financial feasibility (business case) and ensure proper IT requirements – Review and monitor IT budget, financial performance and project cost tracker – Review and approve KPIs for performance management related to the new proposed initiatives – Create a prioritized list of demand requests/projects, and update IT Steering Committee if needed – Approve, adjust or reject demand requests and document reasons for approval or rejection – Provide improvement opportunities, best practices and innovative solutions to the business based on their needs – Recommend IT related policy, standards and procedure improvements – Monitor and recommend improvements to IT performance
Meeting Frequency	**Rules of Engagement**
Quarterly / **Monthly *** / Weekly / Bi-Weekly * Ad hoc meeting may be called by the chair as needed	– Standing committee with a strategic focus – Chair takes the final decisions after consultation with the members – Meeting agenda defined and shared with members prior to the meeting – Documented minutes and decisions – An action log should be in place and updated regularly to provide evidence on committee's activities

1) The chair has the ultimate accountability to drive the committee's decisions and actions

The outcome of the Demand Management Strategy is to have a master implementation plan closely aligned with business needs and priorities, with achievable resource and budget requirements.

8.6 IT CONTROL STRATEGY

8.6.1 IT Governance

The primary aim of IT Governance is to streamline IT decision making related to investments, infrastructure, architecture, security and risks, projects and programs.

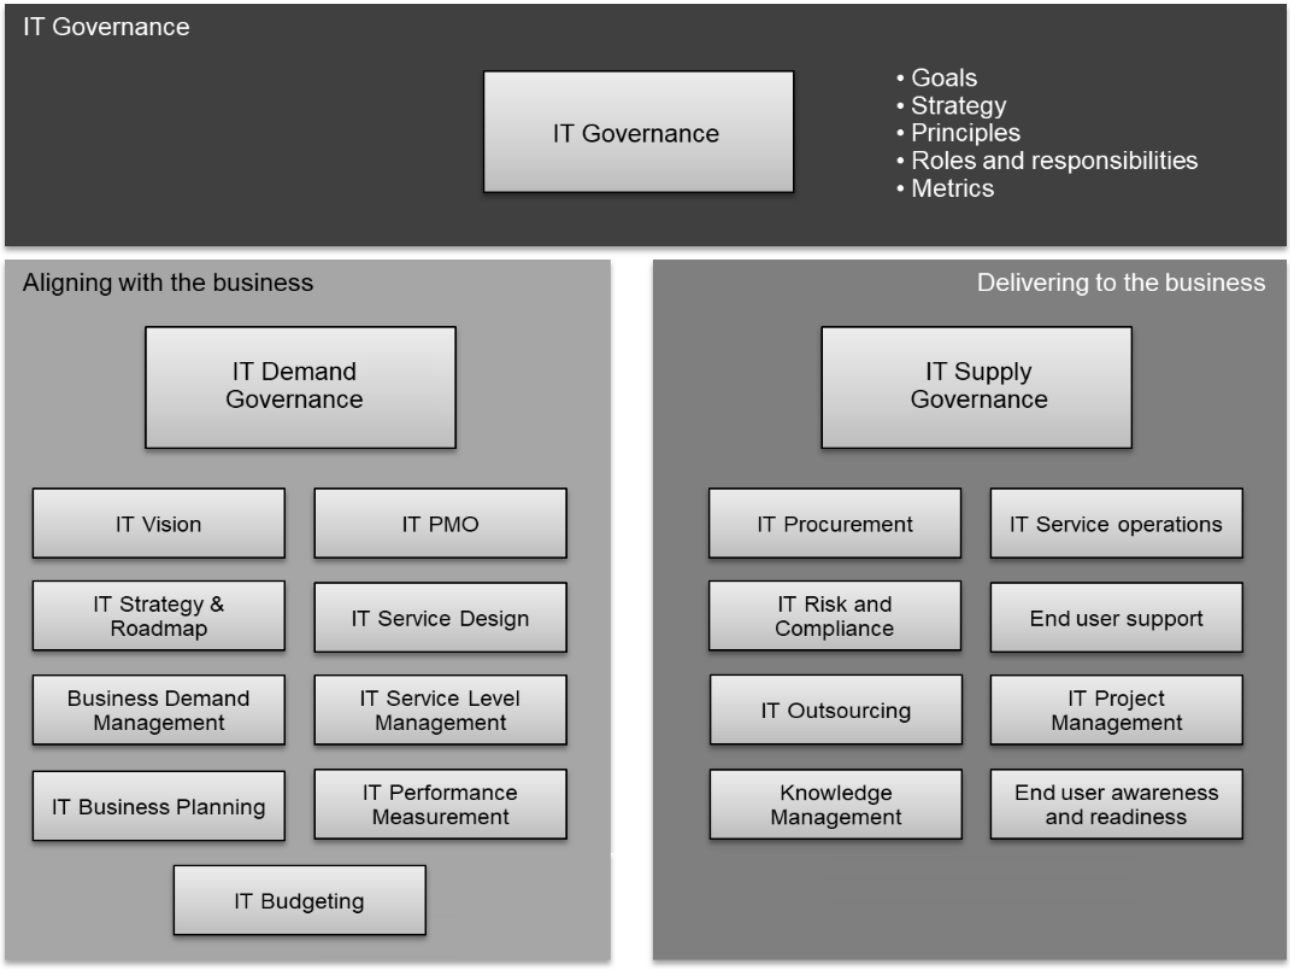
The IT Governance ultimate objective is to deliver a comprehensive framework connecting:

a. Company business requirements to IT architecture and services delivery
b. Company governance and strategy to IT strategy and processes

IT Governance addresses two major topics:

a. IT Demand Governance, aiming to optimize IT investments through close alignment with Company business requirements
b. IT Supply Governance, aiming to deliver IT services and projects as per Dolphin Energy business stakeholders' expectations

The key IT Governance functions for Demand and Supply Governance are summarized in the diagram below:



The demand side of IT governance is focused on establishing alignment between business and IT, as well as providing control for investment decisions:

IT Demand Governance	Primary Objectives
IT Vision	• Maintaining alignment between Company vision, mission and values, and IT strategic principles
IT Strategy & Roadmap	• Ensuring alignment between Company strategy and long-term objectives, and IT strategy • Translating the IT strategy into a comprehensive 3-years long technology and architecture roadmap
Business Demand Management	• Ensuring alignment between business requirements and IT services delivery through Executive (Corporate Information Technology and Security Steering Committee) and Operational (ongoing Demand Management Meetings) coordination

IT Demand Governance	Primary Objectives
IT Business Planning	• Translating the Business Demand Management and the Technology and Architecture Roadmap into a yearly IT Business Plan, aligned with Company Strategic Objectives
IT Budgeting	• Building and processing the IT budget supporting the IT Business Plan, as well as other planned projects and ongoing operational requirements
IT PMO	• Maintain IT project portfolio • Maintain IT project management practices • Support IT project managers
IT Service Design	• Developing service requirements aligned with business needs before engaging in project execution • Ensuring alignment between business requirements and project delivery for any new service
IT Service Level Management	• Maintaining Service Level Agreements with Business Departments • Maintaining Service Level Agreements with external parties • Monitoring potential breaches to agreed service level agreements • Defining required corrective actions
IT Performance Measurement	• Monitoring IT performance through Corporate KPIs, reported regularly to the Strategic and Corporate Planning Department • Defining required corrective actions • Conducting IT Satisfaction Surveys with end users

The supply side of IT governance is ruling the day-to-day services delivery to end users through control metrics, policies and procedures:

IT Supply Governance	Primary Objectives
IT Procurement	• Jointly define the IT Procurement Plan with the Procurement and Contracts Department (P&C) on an annual basis • Follow the agreed Procurement Plan in line with P&C requirements
IT Risk and Compliance	• Maintain IT Risk Register aligned with Corporate Enterprise Risk Management requirements • Address all findings reported through regular IT audits and Information Security assessments
IT Service Operations	• Maintain IT service operations policies and procedures • Operating IT services following ITIL Service Operations best practices
End User Support	• Managing Incident and Request management processes as per ITIL best practices
IT Project Management	• Maintain IT project policies, procedures and documentation • Ensure project delivery in line with agreed deliverables and meeting project stakeholder requirements
End user Awareness and Readiness	• Enforcing end user policies • Maintain an ongoing flow of communication between IT and the end user community • Ensure appropriate user training is given on new and updated solutions, enabling end users to gain the maximum benefits of the IT services delivered
Knowledge Management	• Collecting best practices and lessons learned • Maintaining IT knowledge base
IT Outsourcing	• Manage relationships and contracts with IT Outsourcers • Monitor IT Outsourcing performance • Define any required corrective actions

8.6.2 IT Steering

IT is governed through a number of Steering Committees to ensure alignment, direction, and performance. These are as shown in the below table:

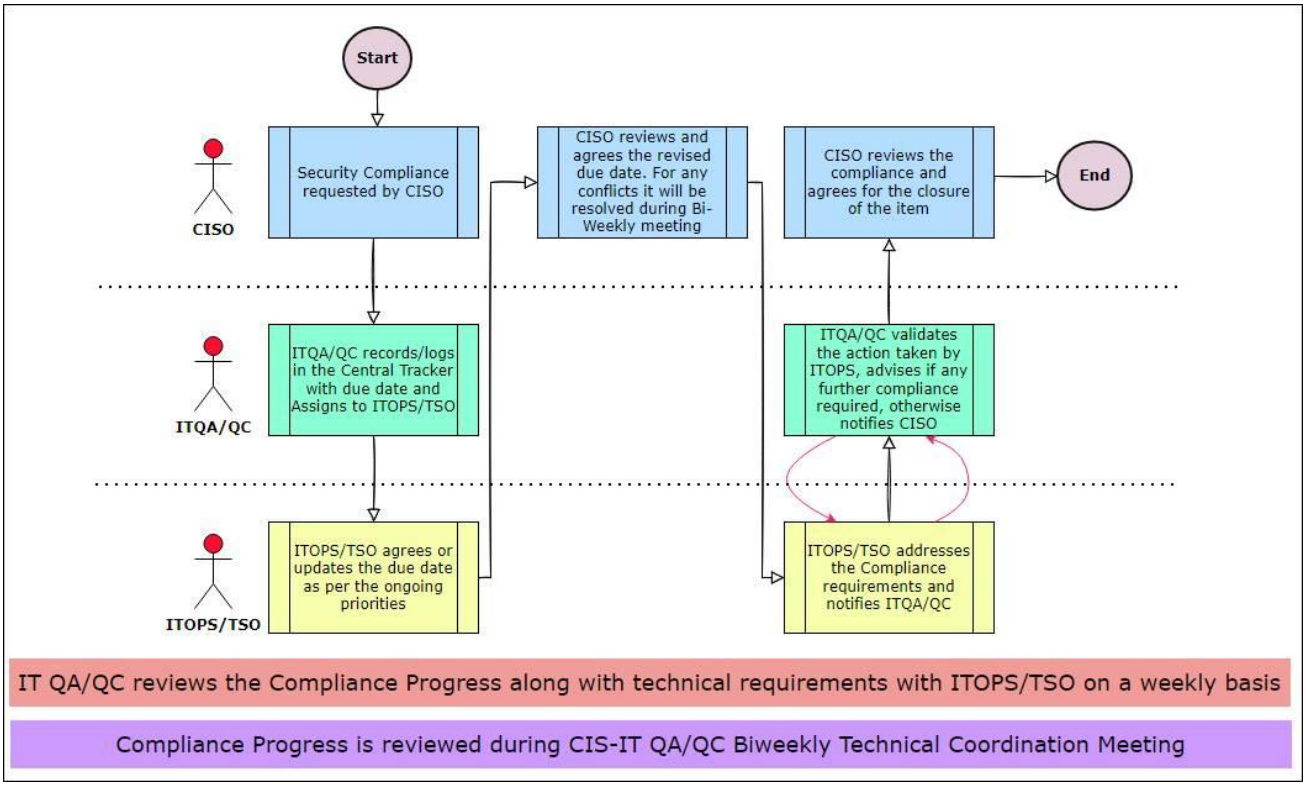
Committee	Objectives	Participants	Schedule
Corporate Information Technology and Security Steering Committee	• Ensuring strategic alignment with the business • Approving IT roadmaps, standards and strategy directions • Reviewing, prioritizing and approving major IT Risks • Reviewing, prioritizing and approving new major IT projects and initiatives • Monitoring IT performance • Approving additional resources and budget allocation and consumption • Monitoring IT Disaster Recovery and Business Continuity planning • Arbitrating on major issues or conflict resolutions	• Senior Management • IT Management • CISO	• Annually in December
IT Outsourcing Steering Committee	• Reviewing IT Outsourcer performance and achievements • Roadmap alignment • Defining potential corrective action plan	• IT Management • IT Outsourcer Management	• Annually in June
IT Innovation and Demand Steering Committee	• Review and endorse IT strategic initiatives, projects and ideas to ensure alignment with Dolphin business strategy • Validate and endorse the business and financial feasibility of new projects • Prioritize and approve, adjust or reject demand requests	• IT Management • IT Subject Matter Experts • Business Owner • Business Sponsor	• Monthly
Budget Review Committee	• Reviewing and approving the IT budget for the following year, based on business requirements and IT priorities	• Senior Management • Finance Members • IT Management	• Annually in August

8.6.3 Information Security and Risk Management

Dolphin Information Security are a separate team outside of Corporate IT, like IT under the Corporate Affairs Division and reporting to the Senior Vice President Corporate Affairs.

Information Security are responsible for defining policies and requirements related to the security of the IT environment, and IT are responsible for maintaining compliance with the defined requirements. This covers security hotfix and patching management, security devices and tools, security hardening and vulnerability closure. To aid in this the management of certain security devices, for example Email Gateways (Corporate) and Reverse Proxies (UAE) are outsourced.

There is a strong alignment between IT and Information Security and multiple activities open between the two teams at any one team. IT Quality and Control are responsible for managing this relationship and tracking the activities through a central repository and dashboard, and frequent meetings with the IT and Information Security Teams, as summarized in the below diagram:



Enterprise Risk Management (ERM) is the responsibility of the Corporate Risk and Quality Department. IT Quality and Control and responsible for maintaining the IT Risk Register, in line with the requirements of the ERM Team.

8.6.4 IT Financial Management

The Dolphin Energy budgeting process takes place during Q2, with a validation by the Budget Review Committee and finally CEO and GM during Q3, before the final budget approval is given.

The IT budget is composed of multiple departments and cost centers, structured as follows:

IT Cost Center	Cost Center Code
Technology Solutions	• Qatar U5506 • UAE M5508
Industrial Solutions	• Qatar U5512 • UAE M5512
IT Operations	• Qatar U5503 • UAE M5502
IT - Support to Operations	• Qatar U1820 • UAE M1821
Operations Software	• Qatar U1822
IT Quality and Control	• Qatar U5509 • UAE M5509

Each IT department collects business requirements and prepare its budget accordingly (CAPEX and OPEX). Infrastructure investments are consolidated under IT Operations budget. Business Projects are funded for the first year by the sponsoring Business Department, with the subsequent support costs for following years falling under the IT budget. IT Projects are budgeted and funded by the related sponsoring IT department.

When a project or an initiative is shared among UAE and Qatar, the practice is to share the costs as follow:

Hardware:	100% in hosting country
Software (infrastructure):	100% in hosting country
Software (users):	100% in hosting country
Software (all users):	75% (Qatar) / 25% (UAE)
Local Service:	100% in hosting country
Shared Service :	75% (Qatar) / 25% (UAE)
Management Support:	50% (Qatar)/ 50% (UAE)

If a project or an initiative involves two or more IT departments, the cost will then be split according.

Regular benchmarking exercises are to be carried out on the IT budget to measure the performance against industry benchmarks.

There is a separate budget for the Digital Transformation Program Future Forward, this is not part of the IT budget, however IT takes on the ongoing support and operations budget of delivered digital projects after the first year.

8.6.5 IT Performance Management

IT performance is regularly monitored and reported on through a number of Corporate Key Performance Indicators which are submitted on a monthly basis to the Strategic and Corporate Planning Department for inclusion into the Corporate Balanced Scorecard and the Corporate Performance Progress Reports. The monthly KPIs are also published in the IT Monthly Report as part of the Monthly Corporate Affairs Report.

An overview of the Corporate IT KPIs can be found in the following table:

KPI Name	Calculation	Reporting Frequency	KPI Target
Availability of Critical IT Services (including communication)	• Average uptime of critical systems and devices (does not include planned downtime)	• Monthly	• 99.9%
Average Deviation of IT Projects Against Agreed Schedule	• (Actual number of months taken to deliver business plan projects / number of months planned) -1 (as a %)	• Monthly	• 15%
Number of Logged Information and Cyber Security Incidents	• Total number of Information and Cyber Security Incidents logged with the IT Helpdesk	• Monthly	• 120 per year
Number of Critical Incidents (severity 1 or 2)	• Number of Severity 1 or 2 incidents reported	• Monthly	• 4 per year
IT Disaster Recovery Time	• Total amount of time taken to complete the annual IT Disaster Recovery testing (for 1 UAE Site and 1 Qatar Site)	• Annually	• 24 hours

KPI Name	Calculation	Reporting Frequency	KPI Target
Percentage of End Users Satisfaction About IT Services	• Overall result taken from the Annual IT End User Satisfaction Survey	• Annually	• 85%
IT Spending per Barrel (BoE)	• Number of BoE sold (natural gas plus by-products) / IT Annual Budget (excluding manpower costs)	• Annually	• $0.07

Additionally, to Strategic and Corporate Planning the progress on the IT Business Plan is reported on quarterly basis, and published in the Corporate Department Objective Progress Report. Where KPIs are not meeting their targets, or the business plan is falling behind schedule, justifications are to be given.

From the IT Green Energy initiative, a number of KPIs are reported to the Sustainability Workgroup on an annual basis, for inclusion to the Corporate Sustainability Report. These are defined as shown in the table below:

KPI Name	Calculation	Reporting Frequency	KPI Target
Energy Savings from IT Equipment Consumption	• Power savings against the baseline taken in 2011 (calculated by power savings initiative estimates are replaced / decommissioned equipment consumptions)	• Annually	• Changes annually, 2022 target 650Mw
Percentage of Physical Servers	• Number of physical servers (not including virtual hosts) / number of virtual machines (as a %)	• Annually	• 3%
Number of Paper Sheets Saved	• Baseline number of papers printed in 2011 - number of papers printed in the current year	• Annually	• Changes annually, 2022 target 2.4 million

KPI Name	Calculation	Reporting Frequency	KPI Target
Total Number of Pages Printed	• Total number of pages printed across all locations, taken from Managed Print Services Contracts	• Annually	• N/A
Total Number of Color Pages Printed	• Total number of pages printed in color across all locations, taken from Managed Print Services Contracts	• Annually	• N/A
Percentage of Color Printing	• Total number of color pages printed / total number of pages printed (as a %)	• Annually	• 50%
Total Number of Printer Cartridges Recycled (Qatar)	• Total number of printer cartridges recycled in Qatar	• Annually	• N/A
Total Number of Printer Cartridges Recycled (UAE)	• Total number of printer cartridges recycled in UAE	• Annually	• N/A
Total Number of Printer Cartridges Recycled Across All Locations	• Total number of printer cartridges recycled in Qatar and UAE	• Annually	• Changes annually, 2022 target 400

IT Outsourcing against contracted SLAs is measured on a monthly basis through monthly reports detailing targets vs actuals with trending analysis against over 30 KPIs covering helpdesk performance, service management performance and managed services performance, as well SLA breaches from the Internal and Outsourced IT Teams.

8.7 IT SUPPLY STRATEGY

8.7.1 IT Services

IT environments are becoming more and more complex over time. Users need to know what IT services are available to them, and the IT Services Catalog provides a complete listing of available services, and the expected service levels.

The IT services used within the Company are categorized and documented in the IT Services Catalog, composed of 2 components:

a. IT Business Service Catalogue – detailing all IT services provided by IT to Dolphin Energy users and business departments. The Business Service Catalogue is the only part of the Service Portfolio published to the users, and is used to support the Service Level Agreement definition with business departments.
b. IT Technical Service Catalogue – containing details of all the technical IT services required to deliver the IT business services. The Technical Service Catalog underpins the Business Service Catalogue and does not form part of the end user view.

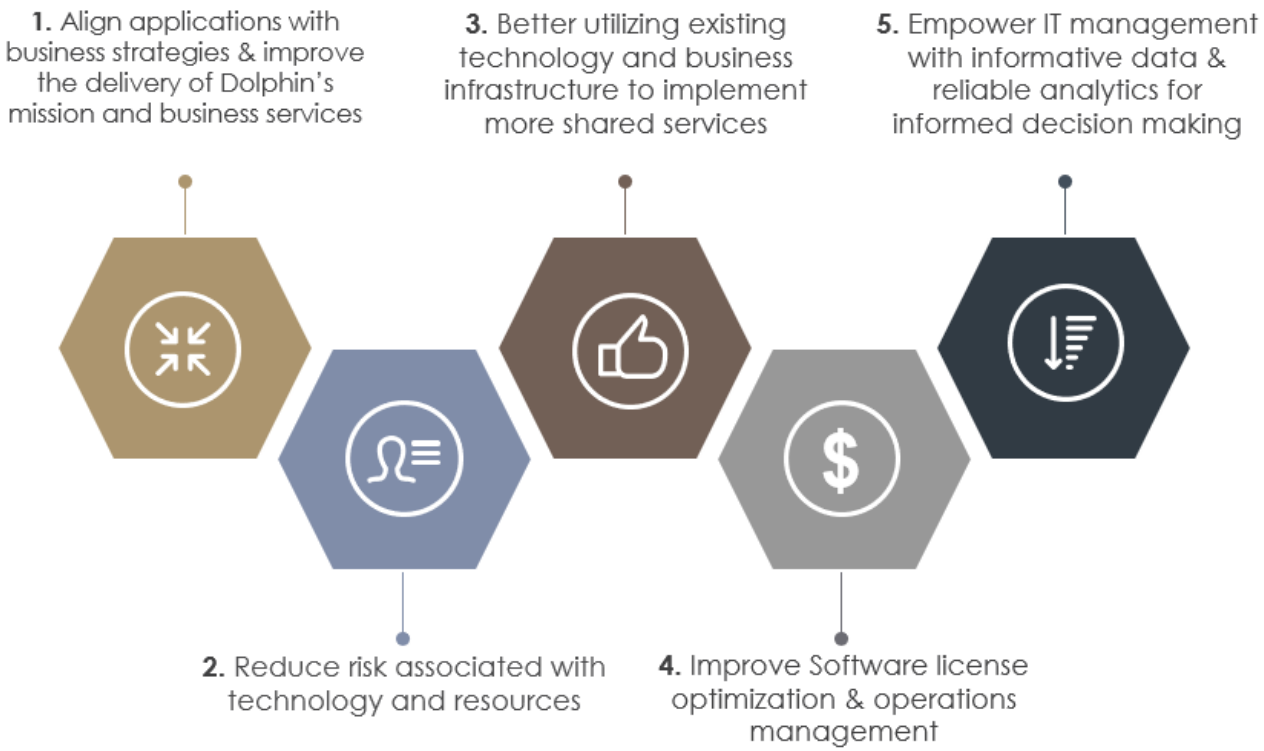
For each IT Business Service, the following service level agreements will be documented, according to the criticality of the related service to the business departments:

a. Availability
b. Response time to any incident
c. Resolution time for a severity 1 incident (high criticality)
d. Resolution time for a severity 2 incident (medium criticality)
e. Resolution time for a severity 3 incident (low criticality)

Standard Core Services will be provided to all users, with other services being requested and then approved by the requester's line manager through an online IT Requisition portal.

8.7.2 Application Portfolio Management

To ensure the ongoing alignment of services delivered with business needs, an Application Portfolio Management program shall be in place, owned by the Technology Solutions Team. The objectives of this program are as summarized below:



The program is built on four main components:

a. Centralized Applications Portfolio Repository – containing all application details such as finances, licenses, operations, security, business priority and architecture.
b. Application Assessment Framework - entailing the technology, business and financial dimension metrics, composed of qualitative and quantitative elements to allow information gathering, facilitate analysis and derive decision-making.
c. Application Rationalization Assessment – covers the requirements for modernization, eliminating unused, or duplicate functionalities, decommissioning applications or improving product operations.
d. Governance Model - to ensure APM sustainability by implementing an adequate performance management through KPIs and effective policies.

8.7.3 IT Service Management

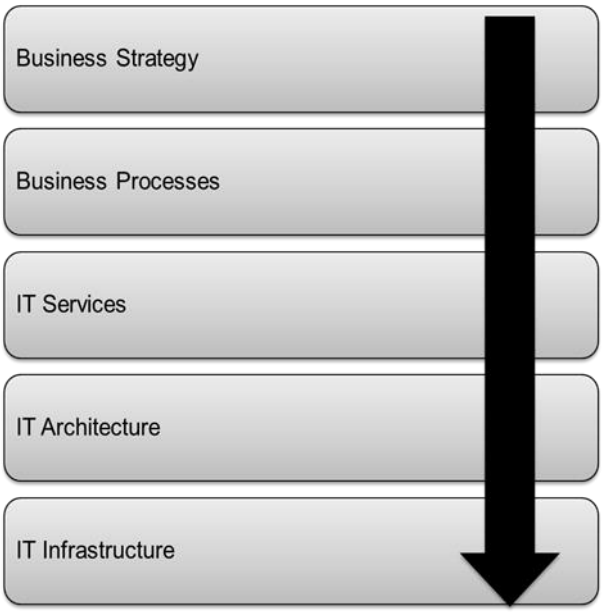
The IT Service Management framework is based on ITIL standards and best practices. The following Service Management processes are used to manage and operate IT services:

Service	Primary Objectives
Service Level Management	• Manage and maintain service level agreements for each IT business service • Measure IT business service performance • Ensure that IT business service performance meets the needs of the business • Define required corrective actions

Service	Primary Objectives
Service Catalog Management	• Provide Business Service Catalog for users to be aware of the available IT services for use • Keep IT business and technical service catalogs up to date and aligned with business needs and service functions
Change Management	• Maintain standardized methods and procedures for efficient and prompt handling of all service-related changes • Reduce the impact on business and on services availability due to poorly managed changes
Release and Deployment Management	• Protect production environment through strict control of releases • Build, test and deliver procedures following clear system assurance strategy, supported by development and quality assurance environments
Request Management	• Support business users by effectively addressing their IT requests following a structured workflow and service level agreement
Incident Management	• Restore normal service as quickly as possible and within the agreed service level targets • Minimize the impacts of incidents on the business • Prioritize the incidents based on business impact
Problem Management	• Prevent occurrence of incidents from happening • Minimize the impact of incidents that cannot be prevented
Configuration Management	• Identify and record information about IT assets and configurations • Provide basis for IT service management • Provide information about the status of infrastructure components

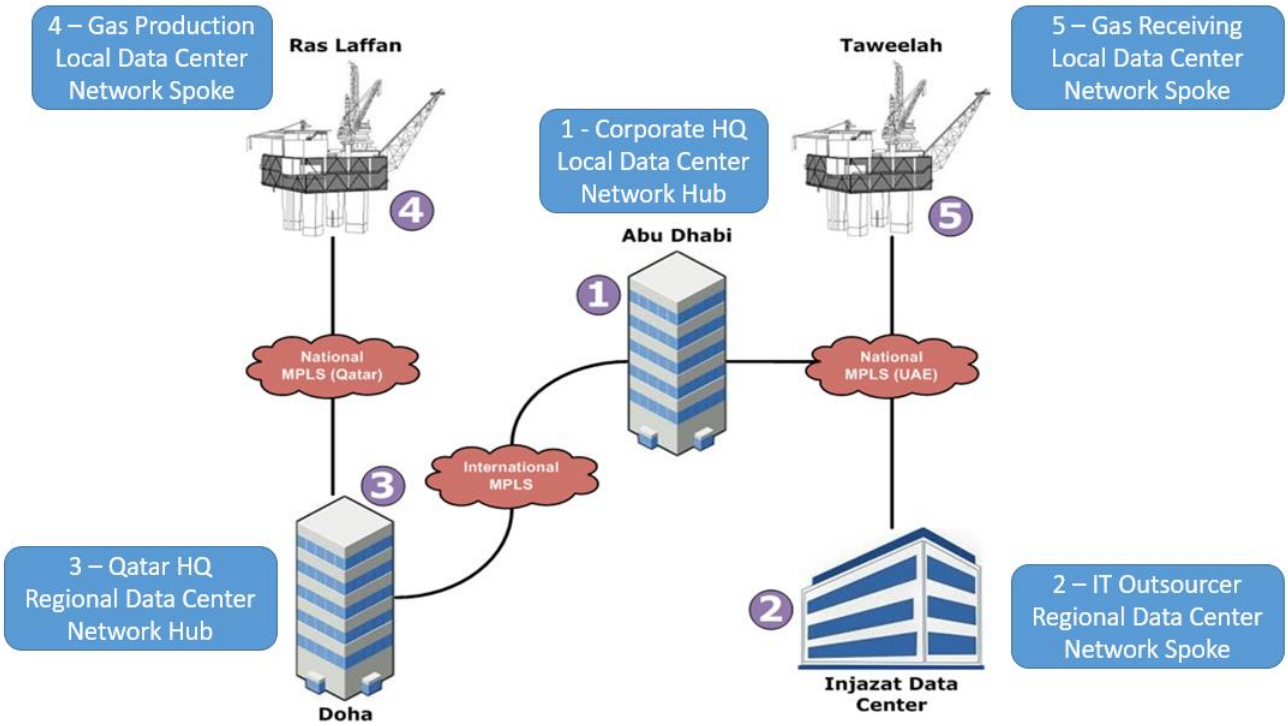
8.7.4 IT Architecture

Enterprise Architecture is the representation of the structure and behavior of an enterprise's IT landscape in relation to its business environment. It reflects the current and future use of IT in the enterprise and provides a roadmap to reach a future state:



The core architecture of the overall environment can be summarized through the following diagram. The environment is built on two main regional data centers, these being the Injazat Data Center and the Data Centers in Doha, with local data centers hosted at the Ras Laffan, Abu Dhabi and Taweelah Sites.

Sites within a region are connected by local Multiprotocol Label Switching (MPLS) network, with International MPLS links between Abu Dhabi and Doha to facilitate communications across regions.



The key directions of the IT architecture strategy are listed below and should be followed wherever possible in the service design phase of all new projects:

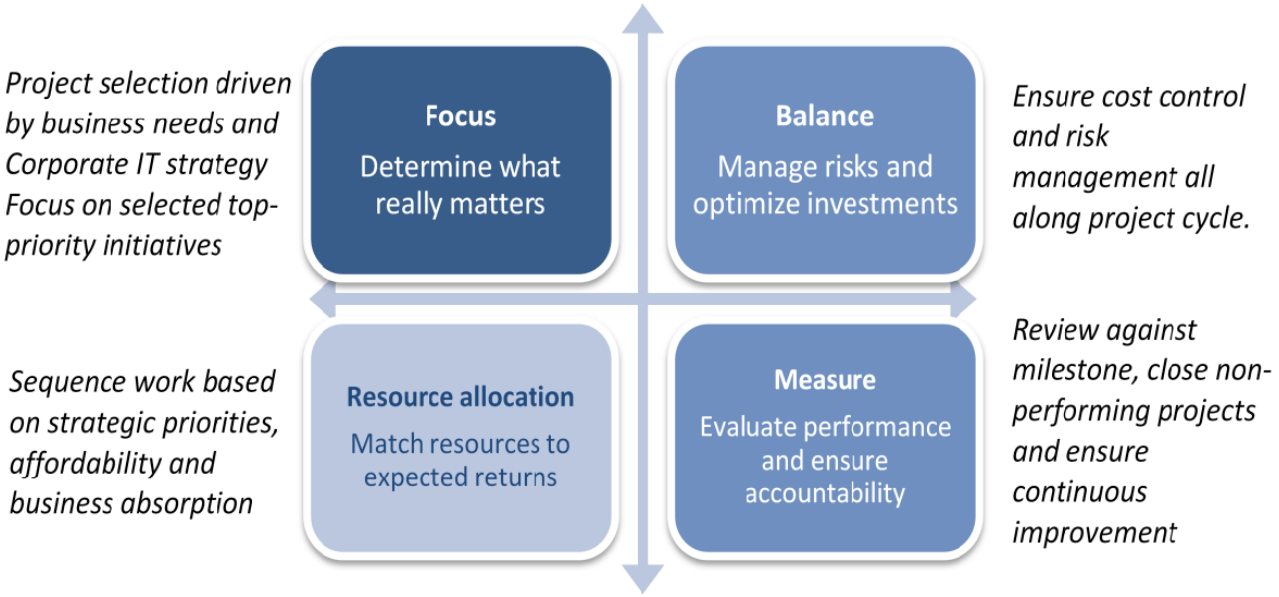
a. Deploy n-1 technology releases where possible
b. Disaster recovery capability by design for business-critical services
c. High availability by design for business-critical services
d. Promote Commercial Off The Shelf (COTS) solutions over custom developments
e. Promote the use of cloud services
f. Promote the use of market leading vendors
g. Promote the use of shared services and infrastructure
h. Promote the use of Service-Oriented Architecture
i. Promote the use of Tiered Architecture
j. Strict alignment with Information Security requirements
k. Virtualize by default

8.7.5 IT Project Management Office (PMO)

The IT PMO is a service provided by IT Quality and Control for the specific purpose of supporting successful delivery of Dolphin Energy IT projects, ensuring adoption of IT Project Management best practices and optimizing alignment with Company corporate goals. The preferred project delivery methodology is Agile.

The mission of the IT PMO is two-fold:

a. Support Corporate IT projects to a successful completion
b. Maintain a foundation for consistent IT project delivery through use of a standard IT Project Management Framework across all IT Teams



The primary objective of Dolphin IT PMO is to maximize the IT projects success rate, provide better visibility on IT projects status, improve the coordination across the IT departments and provide all support required to IT Project Managers appointed to deliver IT projects.

Dolphin IT does not employ dedicated Project Managers, instead the responsibility to manage IT projects is given to IT staff, usually the subject matter expert involved in

the project. The IT PMO is a support organization to IT Project Managers in each IT department, and maintain Corporate IT Project Management standards, templates, tool sets and best practices.

Projects are delivered in five phases, as below:

Project documentation templates are maintained by the IT PMO, with the below set of documentation mandatory for IT Business Plan Projects:

a. Business Case
b. Project Charter
c. High Level Design
d. Low Level Design
e. Project Schedule
f. Risk Register
g. Status Report
h. User Acceptance Testing
i. Defect Log
j. Project Closeout

IT PMO will provide regular project status reporting as defined in the below table:

Report	Description	Provided To	Frequency
IT Business Plan Report	• IT Business Plan progress report	• Strategic and Corporate Planning	• Quarterly
IT PMO Dashboard	• Dashboard highlighting status of all IT Projects, provided as part of Corporate Affairs Monthly Report	• Corporate Affairs Executive Secretary	• Monthly
IT PMO Report	• S-Curve Report for IT Business Plan projects	• IT Management	• Monthly
Project Updates	• Project status and updates provided as part of IT and Digital Transformation Steering Committees	• Senior Management	• Annually

8.7.6 IT Sourcing

The Procurement and Contracts department is a key enabler for the IT strategy and a strong relationship between both departments must be maintained. This relationship is managed through an agreed Procurement Plan derived on an annual basis from the approved IT budget, to plan the IT procurement activities for the coming year and identifying the required date for a PR to be raised in order to meet the required deadline for award. It is important to adhere to this plan in order to avoid delays in the procurement process.

The IT sourcing strategy is based on the following principles:

a. All recurrent procurement activities (hardware, software, network, maintenance, etc.) should be driven either through enterprise agreements or call off contracts
b. Commercial solutions should be favored whenever possible, versus internal developments ("buy not build", for better cost, reliability, support and maintenance)
c. All IT investments should be managed through a contract strategy based on fixed price and performance, as well as leveraging the grouping of contracts and volume licensing where possible, to achieve economy of scale
d. All selected IT solutions must be proven and well established in the market

The IT outsourcing strategy is based on the following principles:

a. Focus on recurrent and standard IT activities
b. Extension to Qatar through shared services

IT is fully aligned with and shall follow Procurement and Contracts policies and procedures when engaging in IT procurement activities.

8.7.7 Business Continuity

Business continuity is the advance planning and preparation undertaken to ensure that an organization will have the capability to operate its critical business functions during emergency events. Events can include natural disasters, a business crisis, pandemic, cyber-attack, or any event that results in a disruption of business operation.

Business Continuity within Dolphin Energy is managed by the Corporate Risk and Quality Department, through a centralized system used by all departments to log their business impact analyses and business recovery plans. Through the mapping of IT services to business processes within this system, a full set of Recovery Time Objectives and Recovery Point Objectives can be extracted. The responsibility of IT is to align IT Disaster Recovery capabilities with these objectives that have been determined by the business.

The IT Disaster Recovery strategy is primarily to use alternative in region company data centers as disaster recovery sites, for example failing over Doha to Ras Laffan or the Injazat Data Center to Abu Dhabi. In certain cases cross region failover is also in place, for example failover of reverse proxy services between Doha, Qatar and the Injazat Data Center in Abu Dhabi, UAE. Finally cloud services are all used for failover, for example the recovery of SAP from the Doha Site to the Azure Cloud.

IT maintain a set of recovery procedures for critical services, which are regularly tested against the target objectives to ensure that business operations can be recovered within the business defined timeframes should a disaster situation arise.

8.7.8 Digital Transformation

Future Forward is the branding for the company Digital Transformation Program. This is not an IT program but a business-driven program, with IT forming part of the Digital Transformation Team, along with Automation, Operations and Communications.

FUTURE FORWARD
CHANGING THE WAY WE WORK

The focus is of the program is on three key pillars:

a. Operations Safety and Security
b. Asset Availability, Reliability and Efficiency
c. Business Productivity Across the Supply Chain

The program has a dynamic strategy which is updated on an annual basis as part of the Corporate Strategy document.

9 PROCESS MEASURE, EVALUATION AND IMPROVEMENT

The effectiveness of the IT Strategy can be measured through the Corporate KPIs on IT performance as detailed within this document.

Please forward suggestions for improvements to this document, or any IT policies, strategies or procedures, to the IT Quality and Control Department (IT.QualityControl@dolphinenergy.com).
